# Ch. 20 The 2<sup>nd</sup> law of thermodynamics

# Irreversible processes and entropy

다음과 같은 과정은 결코 자발적으로 일어나지 않는다.

닫힌 계에서 비가역과정이 일어날 때 엔트로피  $S$ 는 감소하지 않는다.

# The 2<sup>nd</sup> law of thermodynamics

- 1) 계의 다른 변화 없이, 열이 온도가 낮은 곳에서 높은 곳으로 열이 이동할 수는 없다. (완벽한 냉장고는 없다.)
- 2) 계의 다른 변화 없이, 열을 몽땅 일로 바꾸는 것은 불가능하다. (완벽한 엔진은 없다.)
- 3) 고립계의 열역학적 과정에서 엔트로피는 감소할 수 없다.

$$\Delta Q = \Delta E + W$$

entropy

$$\Delta S = S_f - S_i = \int_i^f \frac{dQ}{T} \quad dW = PdV$$

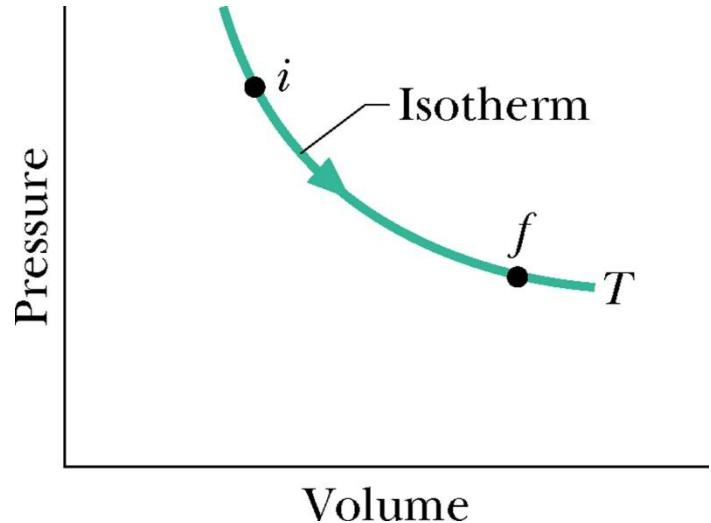

**자유팽창의 경우 – 등온과정을 고려**

$$\begin{aligned}
 \Delta S &= S_f - S_i = \frac{1}{T} \int_i^f dQ = \frac{Q}{T} = \frac{W}{T} = \frac{1}{T} \int PdV \\
 &= \frac{nRT}{T} \ln \frac{V_f}{V_i} = nR \ln \frac{V_f}{V_i} \quad PV=nRT \\
 &= \frac{1}{T} \int_{V_i}^{V_f} \frac{nRT}{V} dV = nR \ln \frac{V_f}{V_i}
 \end{aligned}$$

기체가 등온팽창한 경우

$$\Delta S_{\text{gas}} = + \frac{|Q|}{T}$$

$$\Delta S_{\text{res}} = \cancel{-} \frac{|Q|}{T}$$

닫힌 계에서 과정이 일어나면 엔트로피는  
가역반응에서는 변하지 않지만  
비가역반응에서는 항상 증가한다.  
엔트로피가 줄어드는 법은 없다.

$$\Delta S \geq 0$$

열역학 제2법칙

# 상태함수로서의 엔트로피

reversible process의 경우

$$dE_{\text{int}} = dQ - dW$$

$$dQ = pdV + nC_VdT$$

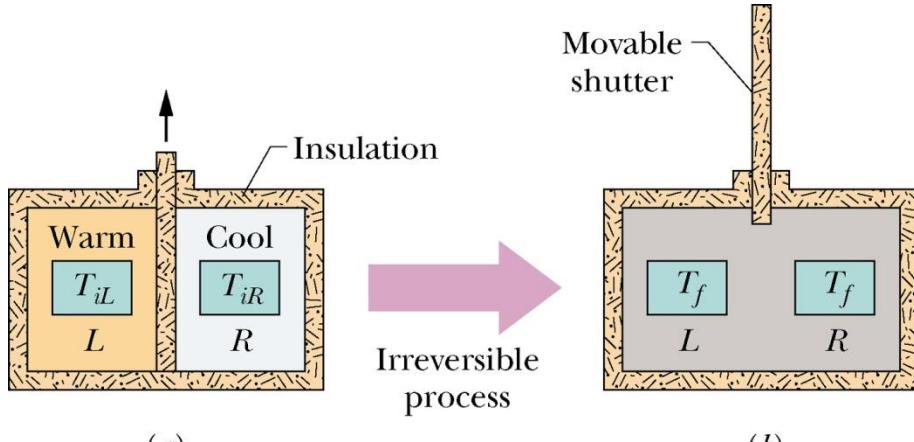

$$\frac{dQ}{T} = nR \frac{dV}{V} + nC_V \underline{\underline{dT}} \leftarrow p = nRT/V$$

$$\int_i^f \frac{dQ}{T} = \int_i^f nR \frac{dV}{V} + \int_i^f nC_V \frac{dT}{T}$$

$$\Delta S = S_f - S_i = nR \ln \frac{V_f}{V_i} + nC_V \ln \frac{T_f}{T_i}$$

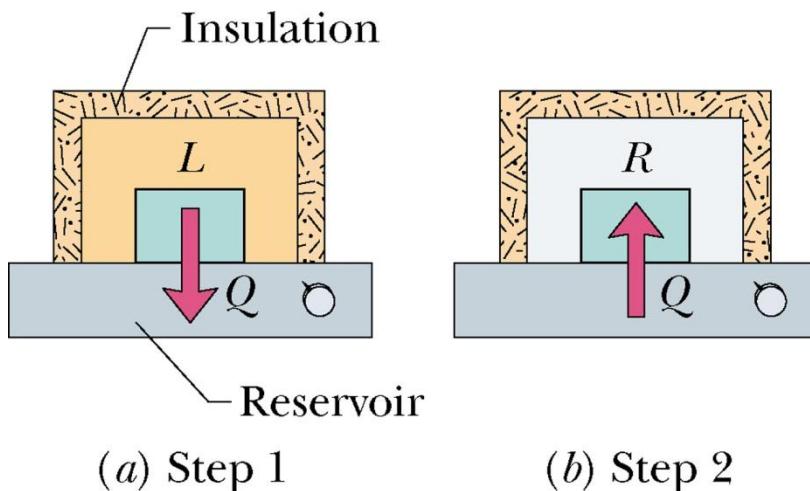

따라서 reversible process의 경우 엔트로피의 변화는 처음 상태와 나중 상태의 부피, 온도에만 의존한다.

# Sample prob.

$$m = 1.5 \text{ kg}, T_{iL} = 60^\circ\text{C}, T_{iR} = 40^\circ\text{C}$$

$$T_f = 40^\circ\text{C}, c = 386 \text{ J/kg} \cdot \text{K}$$

$$dQ = mc dT$$

$$\Delta S_L = \int_i^f \frac{dQ}{T} = \int_i^f \frac{mc dT}{T} = mc \ln \frac{T_f}{T_{iL}}$$

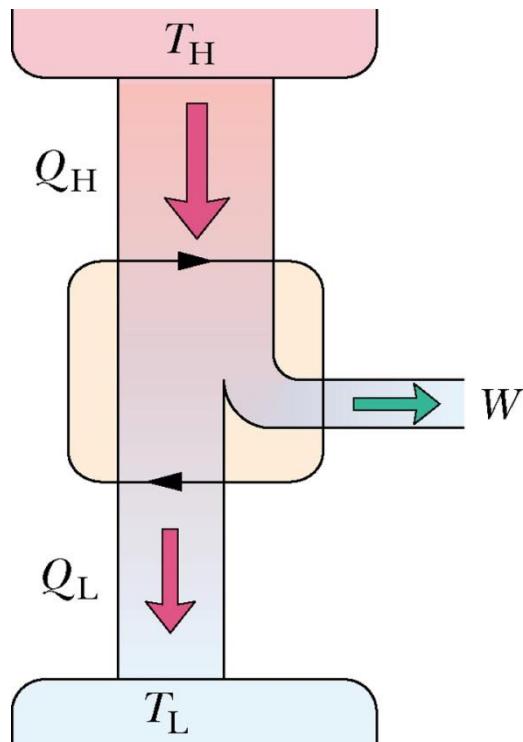

$$\Delta S_R = mc \ln \frac{T_f}{T_{iR}}$$

$$\Delta S = \Delta S_L + \Delta S_R = mc \ln \frac{T_f^2}{T_{iL} T_{iR}}$$

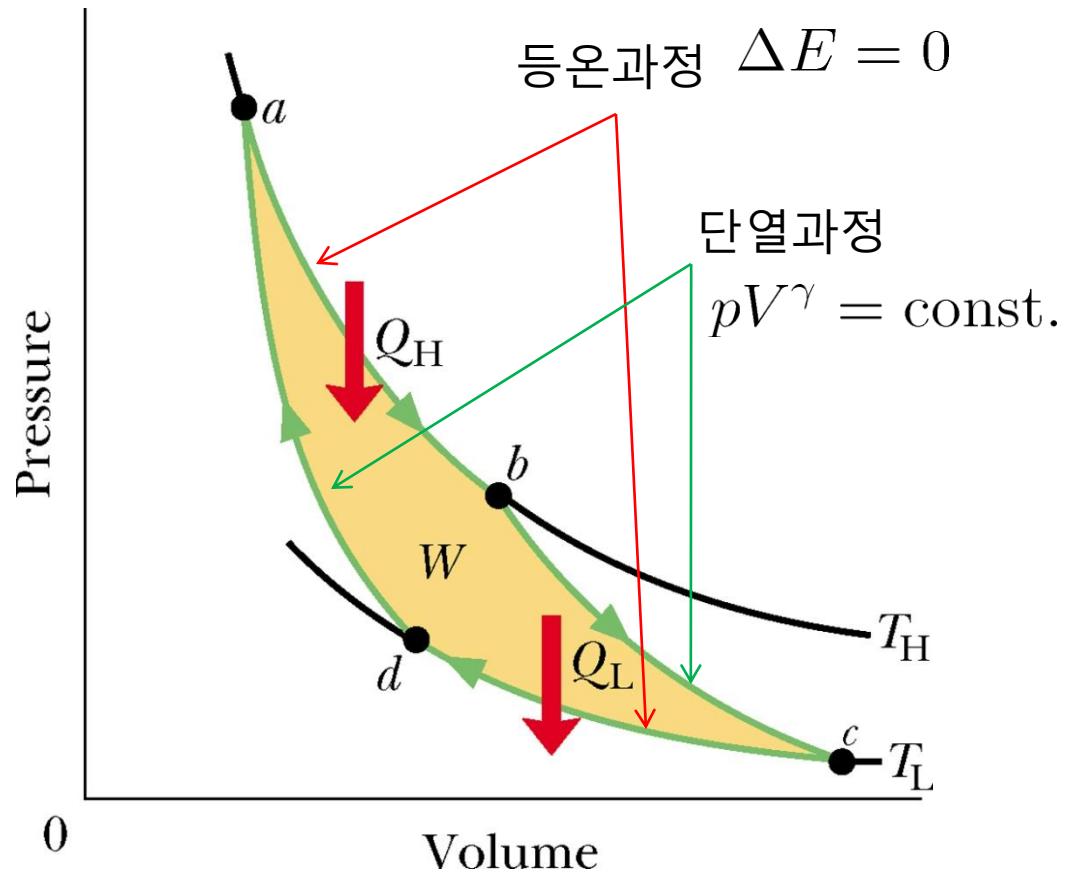

가역반응과 비가역반응의  
엔트로피 변화는 같다.  
(엔트로피는 상태함수이기  
때문)

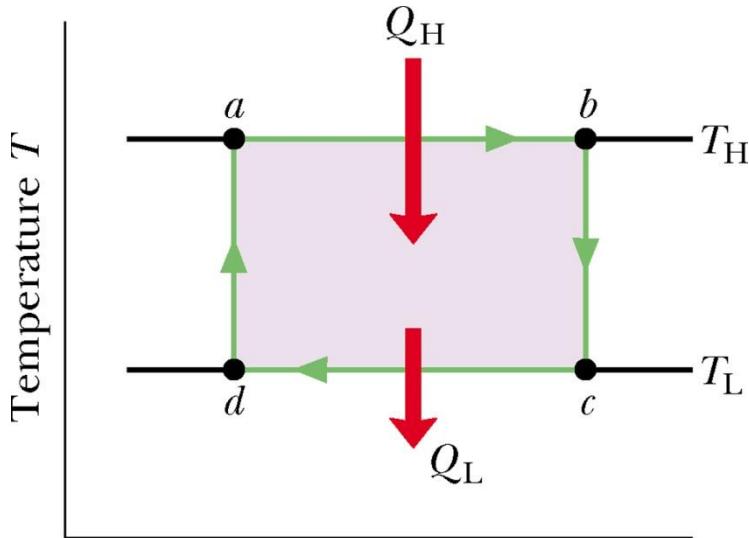

# Engines

Carnot engine: 이상기체를 작용물질로 사용하는 기관

$$pV = nRT$$

Entropy  $S$

열역학 제1법칙

$$\Delta E_{\text{int}} = Q - W = 0$$

$$W = |Q_H| - |Q_L|$$

엔트로피 변화

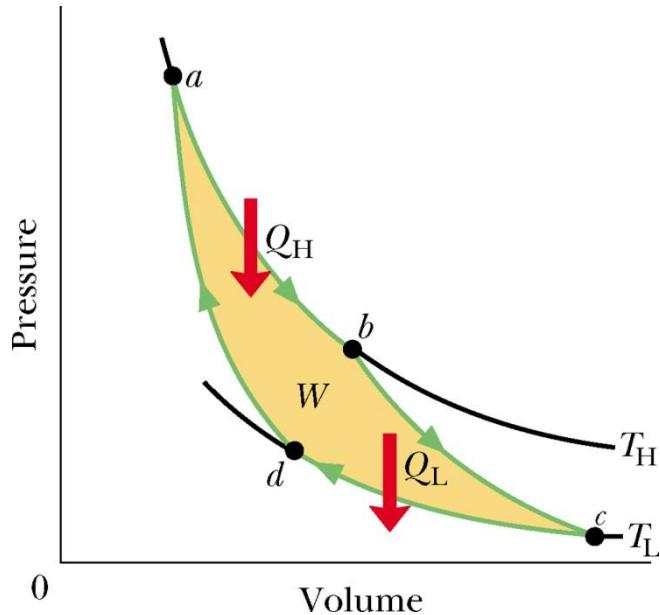

$$\Delta S = \Delta S_H + \Delta S_L = \frac{|Q_H|}{T_H} - \frac{|Q_L|}{T_L} = 0$$

$$\boxed{\frac{|Q_H|}{T_H} = \frac{|Q_L|}{T_L}}$$

$$T_H > T_L \rightarrow |Q_H| > |Q_L|$$

열효율     $\epsilon = \frac{|W|}{|Q_H|}$      $\epsilon_C = \frac{|Q_H| - |Q_L|}{|Q_H|} = 1 - \frac{|Q_L|}{|Q_H|} = 1 - \frac{T_L}{T_H}$

영구기관은 불가능하다.

등온과정

$$|Q_H| = |W_H| = nRT_H \ln \frac{V_b}{V_a}$$

$$|Q_L| = |W_L| = nRT_L \ln \frac{V_c}{V_d}$$

$$\frac{|Q_H|}{|Q_L|} = \frac{T_H}{T_L} \frac{\ln(V_b/V_a)}{\ln(V_c/V_d)}$$

단열과정

$$T_H V_b^{\gamma-1} = T_L V_c^{\gamma-1}, \quad T_H V_a^{\gamma-1} = T_L V_d^{\gamma-1}$$

$$\frac{V_b}{V_a} = \frac{V_c}{V_d}$$

$$\left(\frac{V_b}{V_a}\right)^{\gamma-1} = \left(\frac{V_c}{V_d}\right)^{\gamma-1}$$

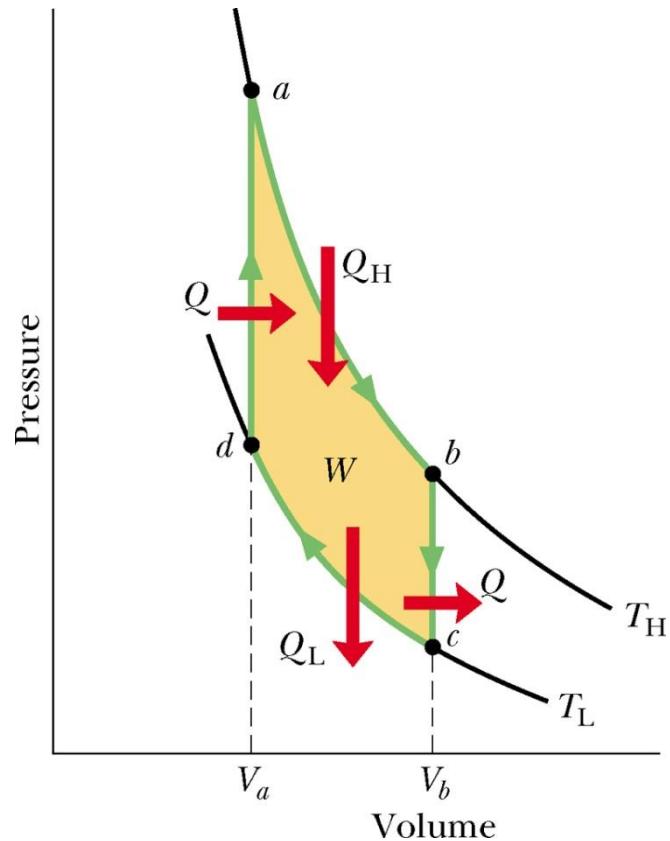

$PV^{\gamma} = \text{const}$

$PV = nRT$

$TV^{\gamma-1} = \text{const}$

$$\frac{|Q_H|}{|Q_L|} = \frac{T_H}{T_L}$$

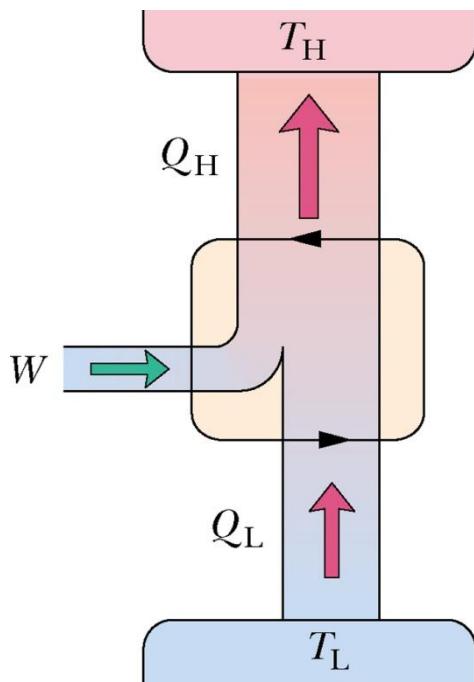

# Stirling engine

# Refrigerator

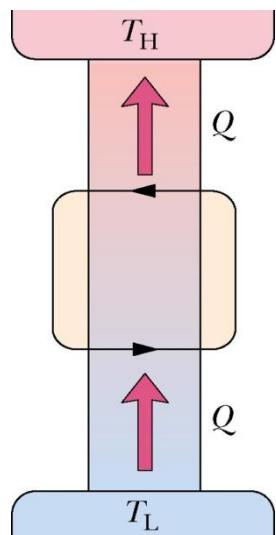

coeff. of performance

냉동기의 작동계수       $K = \frac{|Q_L|}{|W|}$

$$|W| = |Q_H| - |Q_L|$$

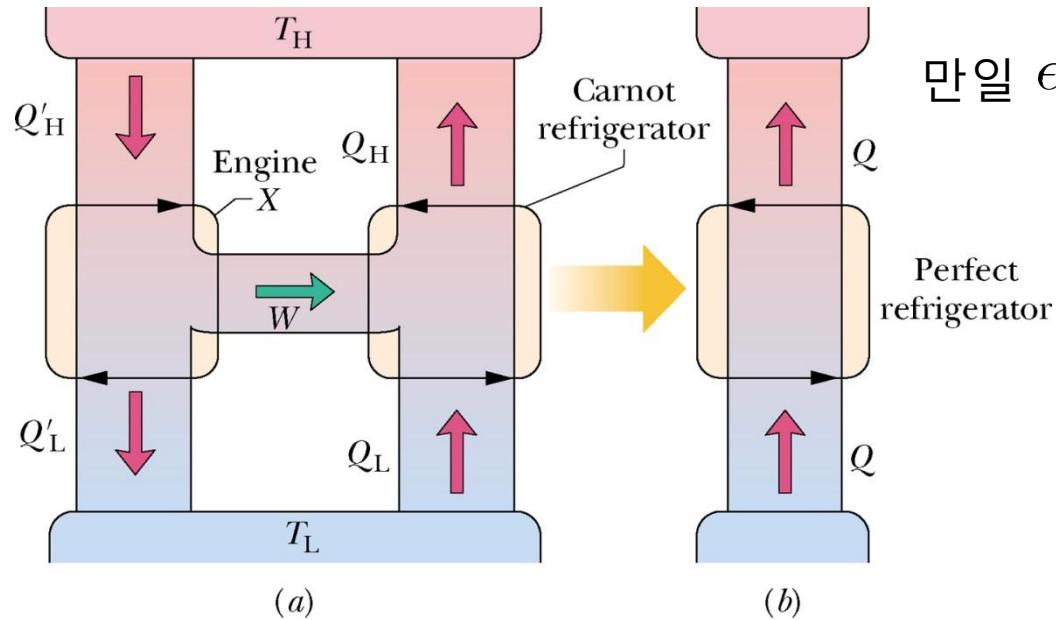

$$K_C = \frac{|Q_L|}{|Q_H| - |Q_L|} = \frac{T_L}{T_H - T_L}$$

영구냉동기는 불가능하다.

$$\Delta S = -\frac{|Q|}{T_L} + \frac{|Q|}{T_H} < 0$$

# Efficiency of real engines

만일  $\epsilon_X > \epsilon_C$ 인 냉동기관이 있다면

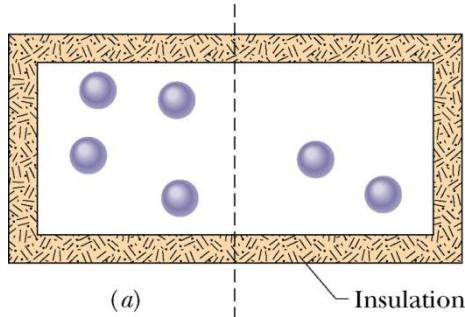

$$\frac{|W|}{|Q'_H|} > \frac{|W|}{|Q_H|}$$

$$\rightarrow |Q_H| > |Q'_H|$$

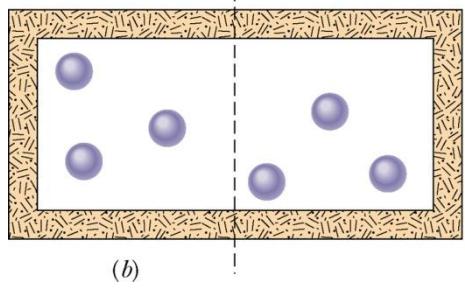

$$W = |Q_H| - |Q_L| = |Q'_H| - |Q'_L| \rightarrow |Q_H| - |Q'_H| = |Q_L| - |Q'_L| = Q > 0$$

동일한 온도 사이에서 작동하는 어떤 실제 기관도 Carnot 기관의 효율보다 높을 수 없다.

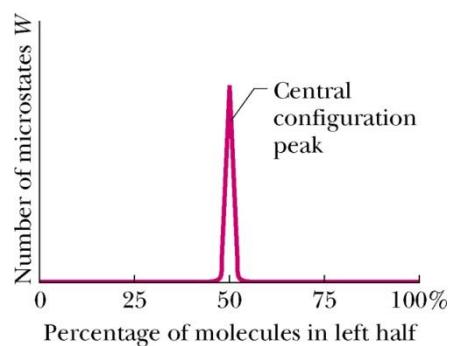

# 통계역학적 관점의 엔트로피

(a)

(b)

$$W = \frac{N!}{n_1!n_2!}$$

모든 미시상태는 동일한 확률을 갖는다.

확률과 엔트로피

$$S = k \ln W$$

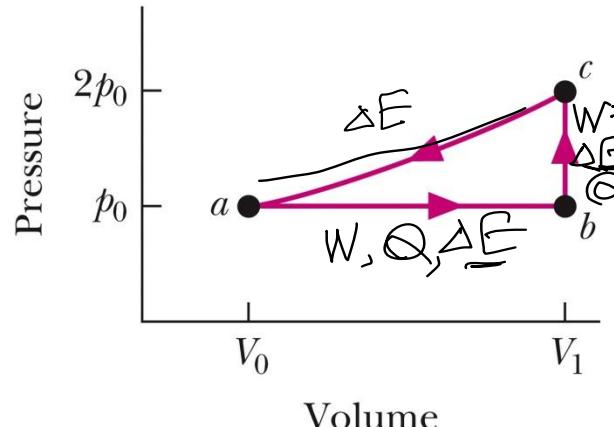

$$\Delta S = \frac{\text{Q}}{T} \rightarrow \frac{kT}{T}$$

Boltzmann

$$\Delta S = k \ln \Omega$$

# Prob. 1

halliday, 9e, fig. 20.24

$$V_1 = 4.00V_0$$

$$\Delta Q = \Delta E_{\text{int}}$$

$$PV = nRT$$

$$P_0 V_1 = nRT_b$$

$$2P_0 V_1 = nRT_c$$

$$\begin{aligned} \Delta E_{\text{int}} &= \frac{3}{2} nR(T_c - T_b) \\ &= \frac{3}{2} P_0 V_1 n \\ &= 6 P_0 V_0 n \end{aligned}$$

$$W = \int P dV = P_0 (V_1 - V_0) = 3 P_0 V_0$$

$$\frac{W}{P_0 V_0} = 3 \quad dS = \frac{dQ}{T} = \frac{dE_{\text{int}}}{T} = \frac{\frac{3}{2} nR dT}{T}$$

$$\begin{aligned} \Delta S &= \frac{3}{2} nR \ln \frac{T_c}{T_b} \\ &= \frac{3}{2} nR \ln 2 \end{aligned}$$

$$\frac{T_c}{T_b} = \frac{2}{5}$$
