It's all about **“predicting the future”!**

It's all about **“predicting the future”!**

How can we predict the **future?**

Why is it so difficult to predict the future?

How to Predict the Future?

- To understand the fundamental principle.
- To apply it to the particular phenomena.

How to understand the universe?

A low-angle photograph of a roller coaster car at the top of a vertical loop. The car is orange and filled with passengers. The track is a complex lattice of silver metal. The background is a clear, bright blue sky.

How can we predict the **motion**?

Tycho Brahe (1546–1601)

(the greatest pre-telescope observer)

Johannes Kepler (1571–1630)

Johannes Kepler, *Tabulae Rudolphinae* (Rudolphine Tables) (1627)

Kepler's Laws of Planetary Motion

(1609, 1619)

The 1st Law

The orbit of every planet is an ellipse with the Sun at a focus.

The 2nd Law

The line joining a planet and the Sun sweeps out equal areas during equal intervals of time.

The 3rd Law

The square of the orbital period of a planet is directly proportional to the cube of the semi-major axis of its orbit.

Galileo Galilei (1564-1642)

Galileo's Principle of Inertia

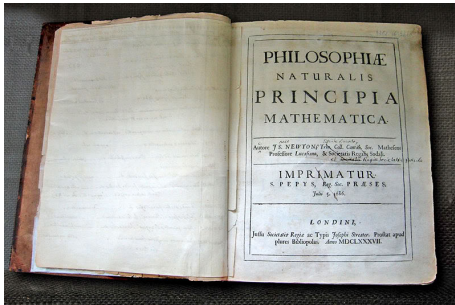

A moving will continue in the same direction at constant speed
unless disturbed.

Discourses and Mathematical Demonstrations Relating to Two New Sciences
(Discorsi e dimostrazioni matematiche, intorno a due nuove scienze, 1638)

Sir Isaac Newton (1643–1727)

Sir Isaac Newton, *Philosophiæ Naturalis Principia Mathematica* (1726)

Newton's Laws of Motion

(Newton, *Philosophiae Naturalis Principia Mathematica*, 1726)

Newton's 1st Law

If no *net* force acts on a body, the body's velocity cannot change.

Newton's Laws of Motion

(Newton, Philosophiæ Naturalis Principia Mathematica, 1726)

Newton's 1st Law

If no *net* force acts on a body, the body's velocity cannot change.

Newton's 2nd Law

The net **force** on a body is equal to the product of the body's mass and its **acceleration**:

$$(\text{force}) = (\text{mass}) \times (\text{acceleration})$$

Newton's Laws of Motion

(Newton, Philosophiæ Naturalis Principia Mathematica, 1726)

Newton's 1st Law

If no *net* force acts on a body, the body's velocity cannot change.

Newton's 2nd Law

The net **force** on a body is equal to the product of the body's mass and its **acceleration**:

$$\text{(force)} = \text{(mass)} \times \text{(acceleration)}$$

Newton's 3rd Law

When two bodies interact, the forces on the bodies from each other are always in magnitude and opposite in direction.

Scientific Determinism

(Laplace 1902)

We may regard the present state of the universe as the effect of its past and the cause of its future. An intellect which at a certain moment would know all forces that set nature in motion, and all positions of all items of which nature is composed, if this intellect were also vast enough to submit these data to analysis, it would embrace in a single formula the movements of the greatest bodies of the universe and those of the tiniest atom; for such an intellect nothing would be uncertain and the future just like the past would be present before its eyes.
